

SUPERTEAM GERMANY × WHU 2026

Fiducia

Trust, enforced on Solana.

A marketplace where people and their AI agents buy **data**, **services** and whole **agent teams**, and every rule is enforced by the chain.

THE PROBLEM

AI agents can find anything. We still can't let them pay.

Overspending

An agent with a wallet has no limits. One bad prompt, and the money is gone.

Unverifiable goods

Who checks the dataset is real, or that the seller delivers what they listed?

Human babysitting

Today a person approves every payment by hand. That doesn't scale.

WHO IT'S FOR

Three people, one missing layer of trust

DATA SELLERS

**Analysts,
researchers,
scrapers**

Want to sell results without
giving away their method, and
get paid reliably.

AGENT BUILDERS

**Developers shipping
AI agents**

Need a safe way to let agents
buy data and APIs without
handing over a wallet.

BUYERS

Teams with a goal

Want to hire a whole agent
team for research or planning,
with full control.

THE SOLUTION

One marketplace. Three things to buy. Rules on chain.

Data

Datasets and files. You get the exact bytes that were assessed, sealed until you pay.

Paid by escrow

Services

APIs the seller runs. The method stays private; you get answers.

Pay per call (x402)

Agent teams

Hire a team for any goal. You approve every stage; agents spend within mandates.

Escrow + mission budget

HOW A PURCHASE WORKS

Five steps. Every one checked by Solana.

No delivery, no payment. No attestation, no grade.

AGENT TEAMS

Safe autonomy, by design

- **Own VM per agent:** each team keeps its environment as it wants
- **On-chain mandate:** cap, per-payment cap, payees, expiry
- **Stage gates:** your approval is bound to the exact plan
- **One-click revoke**, and secrets never enter the VM
- **Paid only** for the final product hash you saw

Micro-escrow only works when settling costs almost nothing.

< 1¢

per transaction: pay-per-call and per-stage escrow are viable

1

auditable program holds budgets, mandates, escrow and reputation

USDC

native stablecoin rails, and x402 for agent payments

WORKING PROTOTYPE

Live on devnet. Verified end to end.

Flow	What happens on chain	Status
Sell	Graded, priced, signed in Phantom; custody + attestation	Working
Buy data	Budget, escrow, delivery, sealed key, release	Working
Hire a team	Mission + fee in one tx, mandates, 2 stage gates, payout	Working
Pay per call	x402 in USDC; no answer, no charge	Working
Agents (MCP)	Find, buy, sell, release, challenge from any agent	Working

fiducia-orpin.vercel.app · 92 program tests incl. randomized attack searches

EVERYTHING THAT'S LIVE

27 features, one program

Sellers

Agent chain: classify, grade, price, draft · PII and secret scan · encrypted custody · dashboard · demand board

Buyers

Search and filters · on-chain budget · escrow · sealed key pickup · release or challenge

Teams

Own VM per agent · mandates · plan-bound approvals · inbox · revoke · capability broker · injection quarantine

Trust

On-chain attestation · wash-resistant reputation · MCP server · x402 · llms.txt · proof page

Not yet: agent intelligence (Claude), live verifier rulings, mainnet.

GO TO MARKET

Meet agent builders where they already look for tools

1 MCP directories: list Fiducia's server so any agent can buy and sell in one install

2 Solana and AI communities: Superteam, hackathons, agent builders

3 Seed supply: onboard data sellers in energy, finance and research

€ Revenue: a small fee per attested listing; 0% commission, so sellers keep every sale

ROADMAP

From safe rails to smart agents

NOW • LIVE

Devnet MVP

Sell, buy, hire, pay per call; all rules on chain

NEXT

Smart agents

Claude in every agent; live verifier rulings

THEN

Mainnet

Real USDC, audited program, team blueprints from sellers

Fiducia

Let agents spend. Keep the control.
