High-Potential Ideas (Curated for WHU Competition)

Selected based on genuine problem-solution fit, Solana's necessity in the product, real market demand, and growth potential — not difficulty or time constraints.

Consumer Crypto × AI (Agentic Payments) **HIGH POTENTIAL**

AI agents that autonomously make micropayments on Solana for services, APIs, compute, or content — without human intervention. As AI proliferates, agents need programmable, near-zero-fee payment rails to transact. Solana is the best chain for this.

Why it's strong: Solana's speed + composability is essential here — not just bolted on. Judges explicitly called out "AI agents making payments" as an inspiration area. Massive addressable market as AI agent economy grows.

Category: AI, Payments

P2P Payments for Bordering Countries **HIGH POTENTIAL**

Fast, cheap, crypto-native cross-border P2P transfers for adjacent nations — bypassing SWIFT, correspondent banks, and Web2 payment apps. Especially relevant for EU cross-border corridors (Germany → Eastern Europe / Turkey / Africa).

Why it's strong: Real pain point, huge TAM (\$600B+ remittance market), Solana's finality and fees make it the only viable blockchain for this. Direct real-world impact story for the pitch deck.

By: Matty Taylor | Category: Payments

Web2-Friendly Yield / Savings App **HIGH POTENTIAL**

A banking-app-style interface on top of Solana DeFi yield — users see a simple savings account but the backend is Solana staking/lending. Bridges non-crypto users into DeFi without them realising it. On-ramp integration included.

Why it's strong: Proven demand (Revolut Savings, Marcus), Solana's ~7% staking yield beats any EU savings account, clear mass-market product story. Perfect for WHU's business-oriented audience to evaluate.

Category: Finance, DeFi, Consumer dApps

ZK-KYC Gateway for Cross-Chain Compliance **HIGH POTENTIAL**

Reusable, privacy-preserving KYC using zero-knowledge proofs — verify once, use everywhere across chains and protocols. No redundant data exposure, lower compliance costs for DeFi protocols, better UX for users.

Why it's strong: Regulatory pressure on DeFi is intensifying (MiCA in EU). A privacy-first compliance layer has institutional demand and is technically differentiated. Germany is a particularly relevant market given EU regulation focus.

Category: Identity, Infrastructure, DeFi

DeFi Credit Score **HIGH POTENTIAL**

On-chain creditworthiness scoring based on a wallet's DeFi history — repayment track record, collateral behaviour, protocol interactions. Enables under-collateralised lending and personalised interest rates in DeFi.

Why it's strong: The \$14T traditional credit market operates on reputation — DeFi has none. First mover on Solana with a strong dataset moat. Unlocks the next wave of DeFi utility for non-crypto-native borrowers.

By: 0x7manish | Category: DeFi, Finance

E-commerce with Blinks **HIGH POTENTIAL**

Embed one-click Solana purchasing directly into any web surface — social posts, emails, messaging apps — using Solana Actions and Blinks. No redirects, no cart, no checkout friction. Any link becomes a buy button.

Why it's strong: Removes the #1 conversion bottleneck in e-commerce (checkout friction). Blinks are a genuinely novel Solana primitive with no Web2 equivalent. Clear monetization path and viral distribution via social.

By: 0xDesigner | Category: Blinks, Consumer dApps

Crypto Payroll & Invoicing for Businesses **HIGH POTENTIAL**

End-to-end payroll and invoicing in stablecoins (USDC) on Solana for freelancers, remote teams, and SMBs. Instant settlement, no banking intermediaries, programmable vesting/streaming with Streamflow, global access.

Why it's strong: Clear business pain point (international payroll is slow, expensive). Solana's near-zero fees make it the only chain where streaming payroll per-second is economically viable. Built-in enterprise pitch angle.

Category: Payments, Finance

Provenance of Digital Assets (AI-era IP) **HIGH POTENTIAL**

On-chain provenance and ownership tracking for digital art, music, and AI-generated content. Immutable record of creation, licensing history, and revenue splits. As AI floods the internet with content, proving authorship becomes critical.

Why it's strong: AI content explosion makes provenance a top-5 unsolved internet problem. Solana's compressed NFTs make storing provenance for millions of assets cheap. First-mover advantage in a regulatory tailwind (EU AI Act).

Category: NFTs, Digital Ownership, AI

Decentralized Marketplace for Collectibles **HIGH POTENTIAL**

Bring the \$500B physical collectibles market (sports cards, sneakers, watches, art) on-chain with tokenized ownership, fractional shares, and trustless escrow. Physical verification via oracles or partner networks.

Why it's strong: Enormous existing market with clear inefficiencies (counterfeits, illiquidity, opaque pricing). Solana's NFT ecosystem is mature. Fractional ownership unlocks asset class for retail investors who can't afford a Rolex.

On-Chain EV Charger Map with Bounties (DePIN) **HIGH POTENTIAL**

Community-verified, real-time EV charger map where contributors earn SOL for adding, updating, and validating charger data. Decentralized alternative to fragmented, often inaccurate CPO data silos.

Why it's strong: Germany leads EU in EV adoption. Problem is real and visible. DePIN with bounties is a proven token-incentive flywheel (Hivemapper). Solana's micropayment rails make per-validation rewards economically viable.

By: DeCharge | Category: DePIN

Solana Passport – Proof of Personhood **HIGH POTENTIAL**

A privacy-preserving, wallet-linked proof-of-personhood protocol on Solana. Enables anti-Sybil protections for airdrops, DAOs, and DeFi. Each real human gets one verifiable credential — no duplicates, no bots.

Why it's strong: Sybil attacks cost protocols tens of millions per cycle. The problem is fundamental to all of Web3. Solana lacks a dominant solution. Potential to become critical infrastructure used by every protocol.

By: Reclaim Protocol | Category: Identity & Privacy

Direct Ticketing via Blinks **HIGH POTENTIAL**

Artists and event organizers sell tickets directly to fans on any channel — social, email, DMs — with programmable resale royalties and anti-scalping logic built into smart contracts. No Ticketmaster, no 30% fees.

Why it's strong: Ticketmaster's monopoly is a publicly hated problem. Blinks make the UX as simple as tapping a link. Programmable royalties mean artists earn on the secondary market. Perfect consumer story for a pitch deck.

By: 0xDesigner | Category: Blinks, Consumer dApps

ColdChain: Decentralized Cold-Chain Logistics on Solana **HIGH POTENTIAL**

Real-time IoT sensor data anchored to Solana for food and vaccine cold-chain tracking. Up to 40% of perishables are lost due to opaque tracking. Immutable on-chain logs create accountability and reduce spoilage.

Why it's strong: Global supply chain (\$15T market) has a verified data integrity crisis. IoT + blockchain + Solana's speed = real-time audit trail. ESG angle makes it attractive to European enterprises and regulators.

Category: DePIN, Infrastructure

Open & Market-Based Scientific Publications **HIGH POTENTIAL**

Replace academic journals with a crypto-native peer review and publishing protocol. Researchers earn tokens for quality reviews; readers pay micro-fees to access; funding decisions are governed on-chain by the scientific community.

Why it's strong: Academic publishing (\$10B market) is broken — perverse incentives, paywalls, slow peer review. DeSci is an emerging Solana ecosystem vertical. Highly resonant with a university audience at WHU.
